

## **In Appreciation of... Electricity Pylons**

*By Brandon P*

Electricity pylons, or transmission towers, are the unsung heroes of the energy world. They might not be the most glamorous structures, but they play a vital role in bringing electricity from power plants to our homes and businesses. Imagine trying to run your life without electricity, it would be like trying to climb Mount Everest in flip-flops!

Pylons come in different shapes and sizes, some designed to be more visually appealing, but let's be real, these metal giants are like the ugly duckling of the energy world. They might not be the belle of the ball, but they get the job done, delivering electricity with a smile.

But did you know that electricity pylons can also be real party animals? With cables hanging out, carrying electricity from one place to another, it's like a non-stop dance party, 24/7. It's the electricity version of a house party, but with less beer and more volts.

Some folks might think that burying the cables underground would be a better solution, but that's not always the case. Burying the cables can be like trying to fit a square peg into a round hole, and it can also have an impact on the environment. So, let's give a round of applause to the electricity pylons, for making sure our lights stay on, even when the party never stops.

In conclusion, electricity pylons may not be the most attractive structures, but they deliver electricity with a smile and a dance. So, the next time you flip on the light switch, take a moment to appreciate the electricity pylon and all that it does for us. After all, without it, we'd be stuck in the dark, trying to power our lives with a rubber band and a hamster wheel.
